# Predicates & Quantifiers

## Induction

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## Predicates

Predicates are  
**Propositions with variables**

Example:

$$P(x,y) \underbrace{::=} x + 2 = y$$

"is defined to be"

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## Predicates

$$P(x,y) ::= x + 2 = y$$

$x = 1$  and  $y = 3$ :  $P(1,3)$  is true

$x = 1$  and  $y = 4$ :  $P(1,4)$  is false  
 $\neg P(1,4)$  is true

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## Quantifiers

$\forall x$  For ALL  $x$

$\exists y$  There EXISTS some  $y$

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## Quantifiers

$x, y$  range over **Domain of Discourse**

$$\forall x \exists y x < y$$

<u>Domain</u>	<u>Truth value</u>
integers $\mathbb{Z}$	True
positive integers $\mathbb{Z}^+$	True
negative integers $\mathbb{Z}^-$	False
negative reals $\mathbb{R}^-$	True

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## Validity

$$[\forall x \forall y Q(x,y)] \rightarrow \forall z Q(z,z)$$

**True no matter what**

- the Domain is,
- predicate  $Q$  is.

## An Example of Induction

Suppose we have a property (say *color*) of the natural numbers:

0, 1, 2, 3, 4, 5, ...

Showing that *zero is red*, and that the *successor of any red number is red*, proves that *all numbers are red*!

## The Induction Rule

0 and (from *n* to *n+1*)  
proves 0, 1, 2, 3, ...

$$\frac{R(0), \forall n \in \mathbb{N} [R(n) \rightarrow R(n+1)]}{\forall m \in \mathbb{N} R(m)}$$

## Proof by Induction

Statements in green form a template for inductive proofs:

**Proof:** (by induction on *n*)

The induction hypothesis:

$$P(n) ::= 1 + r + r^2 + \cdots + r^n = \frac{r^{n+1} - 1}{r - 1}$$

15	8	11	2

## An Aside: Ellipses

Ellipses (...) mean that the reader is supposed to *infer* a pattern.

- This can lead to confusion about what is being stated.
- Here summation notation gives more precision, for example:

$$1 + r + r^2 + \cdots + r^n = \sum_{i=0}^n r^i$$

Copyright © Albert R. Meyer, 2002.

L2-1.12

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## Example Induction Proof

Base Case ( $n = 0$ ):

$$\underbrace{1 + r + r^2 + \dots + r^0}_1 \stackrel{?}{=} \frac{r^{0+1} - 1}{r - 1} = \frac{r - 1}{r - 1} = 1$$

Wait: divide by zero bug!

This is only true for  $r \neq 1$

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## An Example Proof

Revised Induction Hypothesis:

$$P(n) ::= \forall r \neq 1 \quad 1 + r + r^2 + \dots + r^n = \frac{r^{n+1} - 1}{r - 1}$$

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## An Example Proof

Induction Step: Assume  $P(n)$  for  $n \geq 0$  to prove  $P(n+1)$ :

$$\forall r \neq 1 \quad 1 + r + r^2 + \dots + r^{n+1} = \frac{r^{(n+1)+1} - 1}{r - 1}$$

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## An Example Proof

Have  $P(n)$  by assumption:

$$1 + r + r^2 + \dots + r^n = \frac{r^{n+1} - 1}{r - 1}$$

Adding  $r^{n+1}$  to both sides:

$$\begin{aligned} 1 + \dots + r^n + r^{n+1} &= \frac{r^{n+1} - 1}{r - 1} + r^{n+1} \\ &= \frac{r^{n+1} - 1 + r^{n+1}(r - 1)}{r - 1} \end{aligned}$$

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2

## An Example Proof

Continued...

$$\begin{aligned} 1 + \dots + r^n + r^{n+1} &= \frac{r^{n+1} - 1 + r \cdot r^{n+1} + -r^{n+1}}{r - 1} \\ &= \frac{r^{(n+1)+1} - 1}{r - 1} \end{aligned}$$

Which is just  $P(n+1)$   
QED.

6	9	13	7
12	10	5	
3	1	4	14
15	8	11	2
